Data for “School Desegregation and Urban Change: Evidence from City Boundaries.” *American Economic Journal: Applied Economics*

Prepared on May 9, 2011

Combining high school-level and block-level data, 1970

1. high_mindist_120505.txt and high_mindist_2008.dta

These two output files are the result of geocoding school addresses from the ELSEGIS data and using GIS to match Census tracts to their nearest school within the school district (see the ‘step1’ and ‘step2’ readme files for more details). Observations in the files are at the tract level, with state, county and tract codes. The file also contains the code for the nearest school (‘oenum’) and the jurisdiction code for the project (‘jurcode’).

2. OCR_school1970.do and .dta

This do file works with a large school-level dataset from the Office of Civil Rights with information for over 80,000 schools. This data was provided courtesy of Sarah Reber and is not contained in this archive. Readers who may be interested in this data are encouraged to contact Sarah at sreber@ucla.edu. The .dta file contains only the schools in my border sample with data on their racial composition in 1970.

3. mindist_hs_match.do

The file merges the geocoded data matching tracts to their nearest school with both the OCR data and the block-level data in block_1970_aej.dta. It calculates the black enrollment share at the nearest high school.

4. block_1970_withhs_aej.dta

Outfile from the mindist_hs_match.do. This file is in the ‘Main’ folder.
