

Leah Boustan

Data for "School Desegregation and Urban Change: Evidence from City Boundaries." *American Economic Journal: Applied Economics*

Prepared on May 9, 2011

Jurisdiction- and school district-level files

Folder 1: 1970

1. jurisdata_1970_master.txt; jurisdata_1970_expansion1.txt; jurisdata_1970_expansion2.txt
Jurisdiction level demographic data entered by hand for a subset of smaller jurisdictions. The three files here represent three different waves of data collection.

2. juris_CCDB_1970.do, .dta

Reads in electronic jurisdiction level demographic data from the 1972 City Data Book (ICPSR Study No. 61).

3. juris_master_1970_aej.do, .dta

Merges the jurisdiction level data from the City Data Book and from hand entry. Defines variables (such as share black).

4. ELSEGIS_1970.do, .dta, .dct

*Reads in data from the 1969 school year Elementary and Secondary General Information System (ELSEGIS) at the school-district level. Keep information on revenues and expenditures. Merge with the file **oenum_merge.dta** to keep districts in the border area dataset.*

Folder 2: 1980

1. juris_data_1980.txt

Jurisdiction level demographic data. Contains both electronic data from the 1983 City Data Book (ICPSR Study No. 8256) and extra data entered by hand.

2. juris_data_1980.do, .dta

Reads in the .txt file and defines variables. Output file is juris_data_1980.dta.

3. ELSEGIS_1980.do, .dta, .dct

*Reads in data from the 1979 school year ELSEGIS file at the school-district level. Keeps information on revenues and expenditures. Merge with the file **oenum_merge.dta** to keep districts in the border area dataset.*

4. deseg_master_1980.dta

Dataset entered by hand from the State of Public School Integration website compiled by John Logan and maintained by Brown University

(<http://www.s4.brown.edu/schoolsegregation/desegregationdata.htm>). Dataset contains the identifying variable 'jurcode' to match back to block-level data. Variables include year of case decision, outcome of case (was a desegregation plan required? What remedies was the district required to undertake?).

Folder 3: Isolation

1. isolation.do, .dta

This do file reads in works with two large school-level datasets (for 1970 and 1980) from the Office of Civil Rights, each with information for over 80,000 schools. This data was provided courtesy of Sarah Reber and is not contained in this archive. Readers who may be interested in this data are encouraged to contact Sarah at sreber@ucla.edu. The .dta file contains only the schools in my border sample with data on their racial composition in 1970. The .do file uses this school level data to calculate isolation indices for school districts in the sample.

2. oenum_jurcode_xwalk.dta

This crosswalk connects OE numbers ('oenum'), Office of Education school-level identifiers with the jurisdiction codes ('jurcode') used in this project. This crosswalk is used in isolation.do.

Folder 4: Housing_prices

This data is used to create Table 6.

1. merge_CCDB_aej.do

This .do file creates the dataset used to create Table 6 and then runs the regressions underlying Table 6. The .do file begins with the core dataset (created by deseg_results_aej.do in the main directory), collapses the data down to the school district-by-year level and then merges in district (city) level data on housing prices. The city level housing price data is described below.

2. uscity_data.ZIP

Jurisdiction-level data from the City and County Data Books (available on ICPSR) for 1962, 1972, 1983. In particular, the files contain housing prices at the jurisdiction level.
